

Reflex Lab 01 Evidence Packet Guide

This guide explains what to put beside the dashboard-exported evidence packet. The packet is a draft until a human adds physical artifacts and checks the claim boundary.

Packet Claim

Use this narrow claim:

This Reflex Lab 01 build ran `threshold_reflex_v0` on an ESP32 breadboard setup and produced replayable evidence of the pot input, guard decision, LED output, buzzer output, and button mute behavior.

Do not claim certified safety, production control, autonomous operation, or high-current validation.

Required Artifacts

Save these files in the same packet folder:

- `live_trace.jsonl` - exported JSONL capture from the dashboard.
- `replay.html` - exported replay HTML.
- `dashboard_graph.png` or `dashboard_screenshot.png` - the visual graph.
- `validation_output.txt` - output from `tools/validate_trace.py`.
- `replay_output.txt` - output from `tools/replay_trace.py`.
- `FINDINGS.md` - short human notes about what happened.
- `PACKET_MANIFEST.json` - generated after all files are in place.

Physical Photos

Take enough photos that another person can understand the build without trusting your memory.

- `01_parts_layout.jpg` - all components before wiring.
- `02_esp32_on_mini_breadboards.jpg` - ESP32 on the two mini breadboards.
- `03_power_and_ground.jpg` - 3V3 and GND jumpers.
- `04_pot_wiring.jpg` - potentiometer, wiper, and GPIO34 path.
- `05_led_resistor_path.jpg` - resistor, LED anode, LED cathode, and return.
- `06_button_buzzer_path.jpg` - GPIO27 button and GPIO26 buzzer path.
- `07_final_powered_build.jpg` - final powered build.
- `08_dashboard_live_capture.png` - dashboard during or after capture.
- `09_button_mute_action.jpg` - optional still showing the button press.

Tutorial Or Video Links

If there is a tutorial video, add:

- YouTube URL.
- Visibility: public, unlisted, or private.
- Timestamp where the final live capture starts.
- Timestamp where button mute is demonstrated.
- Any mismatch between the video and final wiring.

If no video is published yet, write `not published` instead of leaving the field ambiguous.

Human Findings

`FINDINGS.md` should answer:

- How many guard events happened?
- How long was the guard enabled?
- Did the LED and buzzer follow the guarded output?
- Did the button mute the buzzer while pressed?
- Did anything fail, reset, get warm, or behave unexpectedly?
- What claim is blocked by this packet?

Review

Before calling the packet reviewed:

1. Open `replay.html` and inspect the graph. 2. Compare the replay to the physical photos. 3. Confirm the packet says `review_status: draft` until review is done. 4. Confirm `certified_safety_claim` is `false`. 5. Confirm `production_controller_claim` is `false`. 6. Run the manifest tool after every artifact is added.

```
python tools\make_packet.py evidence\courses\reflex_lab_01\PACKET_ID --out
evidence\courses\reflex_lab_01\PACKET_ID\PACKET_MANIFEST.json
```
